## **Abstract**

The California Department of Pesticide Regulation (CDPR) collected weekly surface water samples at four monitoring sites in the San Joaquin basin (San Joaquin, Stanislaus and Merced counties) between July 2 and September 30, 2002. Samples were analyzed for the pyrethroid insecticides permethrin and esfenvalerate, the herbicides metolachlor and alachlor and their degradation products, and other selected herbicides and organophosphate (OP) insecticides. The results of this study will be used to aid in the development of priorities for future monitoring and/or mitigation efforts.

Analytical concentrations are compared to aquatic toxicity benchmarks, including water quality criteria (WQC) established to protect aquatic organisms. Quantifiable pesticide concentrations are referred to as detections, while the presence of analytes at concentrations too low to be quantified are termed "trace" concentrations. A total of 14 pesticides and pesticide degradation products were detected in 56 water samples. This total included five OP insecticides, six herbicides and three herbicide degradation products. The most commonly detected compounds were dimethoate, diuron, metolachlor, and two metolachlor degradation products, metolachlor ethanesulfonic acid and metolachlor oxanilic acid (metolachlor ESA and metolachlor OXA, respectively).

Dimethoate, diuron and metolachlor were detected at concentrations well below those expected to impact aquatic organisms. Metolachlor ESA was detected in nearly 60% of all samples and was present at trace concentrations in an additional 30% of samples. Metolachlor OXA was detected in approximately 40% of all samples and was present at trace concentrations in an additional 35% of samples. Aquatic toxicity data are not available for the metolachlor degradation products; therefore, the significance of those detections could not be evaluated.

Three insecticides (chlorpyrifos, diazinon and malathion) were each detected in at least one sample at concentrations exceeding established WQC. Chlorpyrifos was detected in about 5% of all samples, with trace concentrations in an additional 7%. WQC for chlorpyrifos range from 0.014 to 0.041  $\mu$ g/L. While chlorpyrifos concentrations exceeded established WQC in three samples, the analytical chlorpyrifos reporting limit of 0.040  $\mu$ g/L was greater than certain WQC so that some additional exceedances may have occurred. The detection frequency for diazinon was similar to that of chlorpyrifos. Diazinon WQC range from 0.05 to 0.09  $\mu$ g/L; the detected diazinon concentration exceeded established WQC in one sample. Malathion was detected in one sample and found at trace concentration in one sample (< 2% of samples each). The single malathion detection exceeded the established WQC of 0.1  $\mu$ g/L.

The remaining detections (methyl parathion, simazine, hexazinone, norflurazon, prometryn, and alachlor ESA) were both infrequent and well below concentrations expected to impact aquatic organisms. There were no detections of the pyrethroid insecticides permethrin and esfenvalerate.

**Appendix 4**. Analytical Method: Analysis of herbicides by Liquid Chromatography/Mass Spectrometry.

**Appendix 5.** Quality Assurance/ Quality Control sample results.

## Introduction

The San Joaquin Valley of California is one of the most productive agricultural areas in the United States. In 1987, approximately 5 percent of the total value of agricultural production in the U.S. was generated in the San Joaquin Valley (USGS, 1998).

In this area during the arid summer months, cultivation of crops such as vegetables, hay and grains, fruit and nuts, and cotton is made possible through the use of extensive irrigation. A wide variety of pesticides are applied throughout the summer irrigation season (CDPR, 2001a). Through runoff or draining of irrigation water, the potential exists for pesticide contamination of adjacent surface water bodies. Relatively little recent surface water monitoring for pesticides has been conducted in the San Joaquin basin during the summer irrigation season. Such monitoring data are needed to characterize the current summer distribution and concentrations of pesticides in the San Joaquin River and tributaries.

The objective of this study was to determine if select pesticides used in the summer irrigation season in the San Joaquin Valley are present in surface waters in measurable amounts, and if so, what typical range of concentrations may be observed. The results presented here will be used to aid in the development of priorities for future monitoring and/or mitigation efforts.

## **Materials and Methods**

#### **Pesticides of interest**

Pesticides were selected for monitoring in this study based on (a) physiochemical properties indicating potential mobility, (b) their relatively high use, (c) potential aquatic toxicity, and/or (d) a lack of current monitoring data.

## Pyrethroid insecticides

Permethrin and esfenvalerate are used on a variety of crops in the San Joaquin basin. During May through August of 2000, the reported use of permethrin and esfenvalerate in the five-county San Joaquin basin area comprised of Fresno, Madera, Merced, San Joaquin, and Stanislaus counties was 56,463 and 6,478 pounds of active ingredient, respectively (CDPR, 2001a). Permethrin use is shown in Figure 1. These pyrethroids were chosen for monitoring in this study because of a lack of summer monitoring data for these compounds in the San Joaquin Valley, and because of their potential for aquatic toxicity (Table 1). Analytical method information for the pyrethroid screen is given in Table 2.

## Metolachlor and degradates

Metolachlor has been classified as a possible human carcinogen by U.S. Environmental Protection Agency Office of Pesticide Program's Carcinogenicity Peer Review Committee (U.S. EPA, 1996). Although the toxicological significance of the metolachlor degradation products (metolachlor ethanesulfonic acid and metolachlor oxanilic acid) is unknown at present, they appear to be mobile, having been frequently detected in the surface water of other states (Kalkhoff et al., 2000; Frey 2001).

During the summer there is relatively high use of metolachlor in the San Joaquin basin, primarily for control of broadleaf and annual grassy weeds in corn and beans. During May through August 2000, 63,899 pounds of metolachlor were applied in the five county San Joaquin River basin area (Figure 2). Metolachlor has been detected in California surface water (CDPR, 2001b), and degradation products of metolachlor have been detected in California groundwater (CDPR, 2001c). The Department of Pesticide Regulation is unaware of the existence of any other monitoring data for metolachlor degradation products in California surface water. While alachlor use is much less than metolachlor, alachlor and its degradates are included in the analytical method for metolachlor and degradates (Table 3) and those results are included here.

## Other potential surface water contaminants

A wide variety of herbicides and OP insecticides are applied in the San Joaquin basin during the summer season (CDPR, 2001a), and several have been detected in San Joaquin Valley surface water (CDPR, 2001b). These include several of the pesticides in the OP and herbicide analytical screens shown in Tables 4 and 5, such as diazinon and chlorpyrifos. Consequently all water samples were analyzed using these two additional analytical methods to provide current information on the presence during summer months of these known contaminants. Over 85,000 pounds of chlorpyrifos was applied in Stanislaus and Merced counties from June through September, 2000 (Figure 3). During the same period, less than 5,000 pounds of diazinon was applied in those two counties.

## Sampling site descriptions

Four surface water monitoring sites were selected in geographical locations with high historical use of permethrin, metolachlor, and a variety of OP insecticides during the summer irrigation season (Table 6). Additional factors which were also considered in evaluating the appropriateness of sampling sites for this study included the identification of previous irrigation season surface water detections of metolachlor and/or OP insecticides and the amount of agricultural drainage /irrigation return water flowing into the water body.

## **Sample Collecting and Handling**

Sampling began on July 2, 2002, and continued throughout the summer until September 30, 2002. Each site was sampled once per week.

For each sampling event, four 1-liter samples were collected at each sampling site and submitted for chemical analysis. One 1-liter sample was submitted for each of the following analyses: pyrethroid insecticides, metolachlor/alachlor and degradates, OP insecticide screen, and herbicide screen.

All water samples were collected directly into 1-liter amber glass bottles using an extendable sampling pole, except for samples collected at the San Joaquin River

(Vernalis) site. At the San Joaquin River site, a weighted sampling container holding a single 1-liter bottle was lowered from the bridge to the river to collect the pyrethroid sample. The additional samples (metolachlor/alachlor, OP, and herbicide screen samples) were collected using a D-77 integrated-depth sampling device with a 3-liter Teflon bottle. The bulk samples collected in this manner were immediately transferred to three 1-liter amber glass bottles.

### **Water Quality Measurements**

At each sampling event, temperature, dissolved oxygen (DO), pH, and electrical conductivity (EC) were measured in situ at each sampling site. DO, EC and temperature were measured with a Yellow Springs Instruments (YSI) multi-meter (model 85). Water pH was measured using a YSI model 60 pH meter or an IQ Scientific Instruments model IQ150 pH meter.

## **Chemical Analysis**

Chemical analysis was performed by the CDFA's Center for Analytical Chemistry. The following methods (Appendix 1) were used to determine the concentrations of pesticides in whole water samples:

- OPs gas chromatography/flame photometric detector (GC/FPD)
- pyrethroids gas chromatography/electron capture detector (GC/ECD)
- herbicide screen atmospheric pressure chemical ionization / liquid chromatography/ mass spectrometry/mass spectrometry (APCI/LC/MS/MS)
- metolachlor/alachlor atmospheric pressure chemical ionization / liquid chromatography/ mass spectrometry/mass spectrometry (APCI/LC/MS/MS).

Method detection limits (MDL) and reporting limits (RL) are presented in Tables 2 through 5. The MDL is defined as in the U.S. EPA definition (40 CFR, Part 136, Appendix B): "the minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater that zero and is determined from analysis of a sample in a given matrix..." The RL is generally

established as 1-5 times the MDL depending on analytical method and matrix, and accounts for the practical decrease in analytical sensitivity due to sample matrix effects. The RL is the lowest level at which concentrations are reported.

Residues determined to be present in a sample at or above the RL are reported here as detections. Residue concentrations between the RL and MDL that are determined by the analytical chemist to be likely due to the analyte of interest are reported as trace detections. The analytical chemist uses his/her best professional judgment to make this determination. No attempt is made to quantitate trace detections. Samples with no residue above the MDL are reported as non-detections (nd).

For pyrethroid analyses (permethrin and esfenvalerate), the whole samples, including any suspended sediment, were extracted and the sample bottle rinsed with extraction solvent for analysis. The pyrethroid analysis results are reported on a whole sample basis (water plus suspended sediment). At the time of this study, the performing laboratory did not yet have available an analytical method for the determination of pyrethroid insecticides in stream bed sediment; therefore, bed sediment samples were not collected.

Quality Control (QC) for the chemical analysis portion of this study was conducted in accordance with Standard Operating Procedure QAQC001.00 (Segawa, 1995). Data generated during the analytical method validation process were used to assess the subsequent study results. The method validation recovery data were used to set warning and control limits. Warning limits were established at the mean percent recovery plus/minus 1-2 times the standard deviation. Control limits were established at the mean percent recovery plus/minus 2-3 times the standard deviation.

Blank-matrix spike samples were analyzed with each extraction set. Blank-matrix spikes are blank water samples fortified with an analyte or analytes at a known concentration and extracted and analyzed with an extraction set. Blind spike samples were also added to some analytical sets. A blind spike is a blank-matrix sample which has been spiked and submitted to the lab disguised as a field sample.

## **Data Analysis - Toxicity Benchmarks**

In order to interpret the significance of the detections in this study, the concentrations of pesticide detections are compared to a variety of aquatic toxicity "benchmarks". These benchmarks and their sources are described below.

The concentrations presented in this report are instantaneous. Comparison of these concentrations to toxicity benchmarks are for illustrative purposes. Such comparisons are not quantitative since instantaneous concentrations do not consider the duration of exposure, and the benchmarks are based on a known exposure time (i.e., 96-hour exposure in a 96-hour LC50 toxicity test). As such, the acute toxicity criteria presented in this report are to be considered general benchmarks for evaluating relative concentration levels (Spurlock, 2001).

All water samples collected in this study consisted of untreated surface water; no samples of drinking water were collected. Sample sites were not adjacent to drinking water intakes, and in general the water bodies sampled are not primary sources of drinking water. As such, the focus in this report is the comparison of detected pesticide concentrations to toxicity data for aquatic organisms and not comparison to drinking water standards developed for the protection of human health.

## Water Quality Criteria (WQC)

The U.S. EPA has developed guidelines for the development of Water Quality Criteria for the protection of aquatic organisms and their uses (U.S. EPA 1985). For a chemical under consideration, information is gathered concerning the material's toxicity to aquatic organisms. The data are reviewed for acceptability and, if enough acceptable data are available, they are used to develop WQC. As described in the EPA guidelines, the WQC provide an estimate of the highest one-hour concentration (Criterion Maximum Concentration, acute exposure) and the highest four-day average concentration (Criterion Continuous Concentration, chronic exposure) that, if not exceeded more than once every three years on average, should not cause unacceptable effects on aquatic organisms and

their uses (U.S. EPA 1985). The U.S. EPA and the California Department of Fish and Game (CDFG) have both developed Water Quality Criteria (WQC) for pesticides detected in this study.

CDFG conducts pesticide aquatic hazard assessments, and when possible, develops numerical WQC for the protection of aquatic organisms. CDFG follows the U.S. EPA guidelines for the development of WQC.

For the purpose of this report, the U.S. EPA and CDFG WQC are considered the most relevant and reliable of the available toxicity benchmarks.

## <u>Canadian Water Quality Guidelines for the Protection of Aquatic Life (Canadian Aquatic Guidelines)</u>

These are guidelines developed by Environment Canada, the Canadian federal agency responsible for environmental protection (Environment Canada, 2003). The guidelines are developed based on toxicity data for the most sensitive species of plants and animals found in Canadian waters. They act as science-based benchmarks for the protection of the aquatic life species in Canada, and should be treated only as general benchmarks for evaluating relative concentrations in U.S. waters such as those described in this report. Data are included to provide some guide to aquatic toxicity where WQC do not exist. These guidelines are available for only a few of the detected pesticides considered in this report.

## **EPA ECOTOX Database**

The U.S. Environmental Protection Agency maintains a database of chemical toxicity information compiled from peer-reviewed literature and U.S. and international government agencies (U.S. EPA 2003). EPA ECOTOX data are included in this report to provide a range of aquatic toxicity data for three selected species (*Ceriodaphnia dubia*, *Daphnia magna*, and *Oncorhynchus mykiss*). The first two organisms are freshwater arthropods, while the common name of the latter is rainbow trout. Individual studies were not reviewed. Data are included primarily to provide some guide to aquatic toxicity

where WQC or other aquatic guidelines do not exist. In order to provide a conservative estimate of the significance of detections, the lowest LC<sub>50</sub> for the most sensitive of the three species is used as the toxicity benchmark in this report.

## Results

## Water quality measurements

Water quality measurement results are shown in Tables 7 through 10.

### Orestimba Creek at River Road

Over the course of the study, the pH at Orestimba Creek ranged from 7.1 to 7.8. Measured water temperature ranged from 16 to 25.4 °C. DO and EC had ranges of 6.21 to 8.28 mg/L and 641 to 887 µS/cm, respectively.

## Salt Slough at Highway 165

The pH at Salt Slough ranged from 6.49 to 7.66. Measured water temperature ranged from 18.9 to 26.9 °C. DO and EC had ranges of 5.14 to 7.37 mg/L and 877 to 1188  $\mu$ S/cm, respectively.

## San Joaquin River near Vernalis

The pH at Vernalis ranged from 7.01 to 9.03 . Measured water temperature ranged from 19.3 to 25.7 °C. DO and EC had ranges of 7.79 to 12.5 mg/L and 454 to 870  $\mu$ S/cm, respectively.

### Tuolumne River at Shiloh

The pH at the Tuolumne River site ranged from 6.96 to 8.4. Measured water temperature ranged from a low of 19.3 to a high of 26.7  $^{\circ}$ C. DO and EC had ranges of 6.44 to 10.0 mg/L and 165 to 285  $\mu$ S/cm, respectively.

## Chemical analysis results

Pesticide analysis results by sampling site are shown in Tables 11 through 14. Graphical representation of the results are given in Figures 4 through 7. Blind spike and continuing QC results for each of the analytical screens are presented in Appendix 5.

## **Sampling Sites**

Salt Slough at Highway 165

Diuron and metolachlor were the most commonly detected pesticides at Salt Slough, with detection frequencies of 79 and 64 percent, respectively Table 11). These two pesticides also displayed high concentrations relative to other detected pesticides, with maximum concentrations of 0.582 and  $0.951~\mu g/L$  for diuron and metolachlor, respectively. Other pesticides that were detected during the fourteen sampling events at Salt Slough were dimethoate (1 detection), chlorpyrifos (1 detection), hexazinone (4 detections), metolachlor ESA (5 detections), and metolachlor OXA (2 detections).

The single chlorpyrifos detection of  $0.046~\mu g/L$  at Salt Slough exceeded both the CDFG chronic and CDFG acute WQC of 0.014 and  $0.02~\mu g/L$ , as well as other toxicity benchmarks shown in Table 15. Chlorpyrifos was also found at trace concentrations in two additional samples. Diazinon was not detected above the RL at Salt Slough, but was present at trace concentrations in two samples. No other pesticide detections exceeded any of the toxicity benchmarks.

## Orestimba Creek at River Road

Diazinon and chlorpyrifos were detected at concentrations exceeding toxicity benchmarks (Table 12, Table 15). Of the 14 samples collected at Orestimba Creek, diazinon was detected three times (21% detection frequency), with concentrations of 0.043, 0.046, and 0.276 μg/L. The two lowest detected concentrations were just below the CDFG chronic WQC of 0.05 μg/L. The 0.276 μg/L detection exceeded all three of the established WQC (Table 15). The three samples with quantifiable diazinon detections were taken from consecutive sampling events at Orestimba Creek (8/5, 8/12)

and 8/19, 2002). This could indicate an extended period of diazinon presence in the creek.

Chlorpyrifos was detected in one sample at 0.0705 µg/L, and found at trace concentrations in one additional sample. The detection exceeds several of the toxicity benchmarks presented here, including both the acute and chronic CDFG WQC. Malathion was detected in one sample, at 0.111 µg/L. This concentration exceeded the U.S. EPA WQC of 0.1 µg/L, but was well below the CDFG acute WQC of 0.43 µg/L. Diazinon, chlorpyrifos and malathion detections were confirmed by gas chromatography/mass spectroscopy (GC/MS). No other pesticides detected at Orestimba Creek exceeded the toxicity benchmarks.

Both metolachlor degradation products were found at concentrations above the RL more frequently than the parent compound. Metolachlor ESA and metolachlor OXA were detected in 100% and 64% of samples, respectively; metolachlor was detected in 57%.

Dimethoate was detected in 86% of samples, and diuron in 43%, with maximum detections of 0.696  $\mu$ g/L and 0.354  $\mu$ g/L, respectively. Additional compounds detected were simazine (3 detections) and methyl parathion, hexazinone, and alachlor ESA (1 detection each).

#### Tuolumne River at Shiloh

There were fewer detections of sampled pesticides at Shiloh than at the other three sampled sites (Table 13, Figure 6).

Chlorpyrifos was detected at Shiloh in one sample, at  $0.056 \,\mu\text{g/L}$ . This detection, confirmed by GC/MS, exceeded several toxicity benchmarks, including both the acute and chronic CDFG WQC (Table 15). Diazinon was not detected above the RL, but was found at trace concentrations in two samples.

Dimethoate and diuron both had detection frequencies of 21%. Maximum detected concentrations were 0.223 and 0.07  $\mu$ g/L, respectively. Norflurazon was detected in one sample, at 0.281  $\mu$ g/L

There were no detections of metolachlor or either of its degradates. A trace concentration of metolachlor was found in one sample, and trace concentrations of metolachlor ESA were present in 8 of 14 samples.

### San Joaquin River near Vernalis

Metolachlor and its two degradation products, metolachlor ESA and OXA, were the most commonly detected compounds at Vernalis; at least trace concentrations of all three were found in every sample collected there (Table 14). Concentrations above the RL were more frequent for the degradates than for the parent compound, with detection frequencies of 100 and 79% for metolachlor ESA and OXA, respectively, and 21% for the parent compound.

Dimethoate and diuron were detected in 50% and 64% of Vernalis samples, respectively, with maximum detections of  $0.073 \,\mu\text{g/L}$  and  $0.124 \,\mu\text{g/L}$ , respectively. Prometryn was detected in two samples, chlorpyrifos and hexazinone were found at trace concentrations in one sample each. Diazinon was not found in any sample taken at Vernalis.

None of the detections at Vernalis exceeded any of the toxicity benchmarks.

## Pesticides

### Chlorpyrifos

The RL for the chlorpyrifos analytical method used in this study is  $0.040~\mu g/L$ , greater than both the CDFG acute WQC of  $0.02~\mu g/L$  and the CDFG chronic WQC of  $0.014~\mu g/L$ . The MDL for the method is  $0.0109~\mu g/L$ . Consequently WQC exceedances may have occurred that could not be detected by the analytical method. A more sensitive analytical method for chlorpyrifos is needed in order to assess more accurately how frequently the WQC are exceeded.

The CDFG acute WQC for chlorpyrifos was exceeded one time at each of the sampling sites except for Vernalis; trace concentrations were found at Vernalis in one sample (Table 16). Chlorpyrifos was found at trace concentrations or higher in two samples at Orestimba (ca. 15% of samples) and 3 samples at Salt Slough (> 20% of samples). The three samples from Salt Slough that contained chlorpyrifos were collected at three consecutive sampling events:  $0.046 \,\mu\text{g/L}$  on 8/19/02, and trace amounts on 8/26/02 and 9/3/02. This may be an indication that the concentrations of chlorpyrifos in this water body were high enough to impact aquatic organisms for an extended period of time.

## Diazinon

Diazinon was detected above the reporting limit three times at Orestimba Creek (> 20% of Orestimba Creek samples) and was present at trace concentrations at Salt Slough and Shiloh two times each (Table 16). No diazinon was detected in any sample taken during this study at Vernalis. Established diazinon WQC were exceeded once, at Orestimba Creek.

In previously reported studies, toxicities of diazinon and chlorpyrifos to *Ceriodaphnia dubia* have shown additivity (Bailey et al. 1997, CDFG 1999, 2001a). In this study there were no instances of detectable concentrations of both diazinon and chlorpyrifos cooccurring in a single sample.

## Dimethoate

Dimethoate was detected in 23 samples (41% of all samples collected), with a maximum concentration of 0.696  $\mu$ g/L. The CDFG conducted a hazard assessment of dimethoate (CDFG, 1996) but was unable to issue a WQC due to insufficient data. Of the data that CDFG reviewed and found acceptable in this assessment, the most acutely sensitive freshwater species tested was the stonefly *Pteronarcys californica*, with a mean 96-hour LC<sub>50</sub> for this organism of 43  $\mu$ g/L. Of nine values listed in the U.S. EPA's ECOTOX database, the lowest 48 hour LC50 for *Daphnia magna* was 580  $\mu$ g/L. The Canadian

Aquatic Guideline for dimethoate is  $6.2 \mu g/L$ . None of these benchmarks levels were exceeded in the samples collected during the study.

#### Malathion

Malathion was detected in one sample at 0.111  $\mu$ g/L (Orestimba Creek); this concentration exceeded the U.S. EPA WQC of 0.1  $\mu$ g/L. The CDFG acute WQC of 0.43  $\mu$ g/L for malathion was not exceeded during the study. Additionally, EPA's ECOTOX database show the LC50's for three aquatic species (Table 1) to be on the order of 1.1  $\mu$ g/L and higher, at least one order of magnitude above the highest malathion concentration.

#### Diuron

Diuron was detected in 29 samples (> 50% of samples), with a maximum concentration of  $0.582 \,\mu g/L$ . No WQC or Canadian Aquatic Guideline exist for diuron. The herbicide has a low aquatic toxicity, with a reported 96-hour LC50 for *Daphnia magna* of 400  $\mu g/L$  (Table 1).

#### Metolachlor

Throughout the study, metolachlor, metolachlor ESA, and metolachlor OXA were detected in approximately 35%, 59% and 39% of samples collected, respectively. For all three of these compounds, trace concentrations were found in an additional 30 to 40% of samples. Of the 56 total samples collected, 51 (90%) had at least trace detections of either metolachlor or a metolachlor degradation product.

The maximum concentration of metolachlor detected was 0.951 µg/L. No WQC have been issued for metolachlor; the Canadian Aquatic Guideline for metolachlor is 7.2 µg/L. The lowest metolachlor 48 hour LC50 for *daphnia magna* listed in the U.S. EPA ECOTOX database is 15400 µg/L. The U.S. EPA Lifetime Exposure Health Advisory for metolachlor is 100 µg/L (U.S. EPA 2002). This is the concentration of metolachlor in drinking water not expected to cause any adverse effects for a lifetime of exposure, including an adjustment for possible carcinogenicity.

The maximum concentrations for metolachlor ESA and OXA were 0.502 and 0.113  $\mu$ g/L, respectively. Metolachlor ESA was detected above the RL in 100% of samples taken at both Orestimba Creek and Vernalis. Metolachlor OXA was detected above the RL in nearly 80% of samples taken from Vernalis, and in over 60% of samples collected at Orestimba Creek. Additional samples at both of these sites had trace concentrations of this compound. No WQC have been issued for the metolachlor degradation products, and no aquatic toxicity information is available for these compounds.

## Other pesticides

Methyl parathion was detected in one sample at  $0.048\,\mu\text{g/L}$ , which did not exceed the CDFG interim WQC of  $0.080\,\mu\text{g/L}$ , or any of the other toxicity benchmarks presented in Table 15. Alachlor ESA was detected in one sample and found at trace concentrations in 7 samples. The remaining pesticides that were detected in this study, simazine, hexazinone, norflurazon, and prometryn, were detected infrequently and at concentrations well below the toxicity benchmark levels. There were no detections of permethrin, esfenvalerate, alachlor, or alachlor OXA in any sample at any of the four sampling sites. Precipitation during the time period of the study was negligible, so the off-site movement of pesticides observed in this study was not caused by storm-induced run off.

## **Quality Control**

All QC sample results are listed in Appendix 5.

## Pyrethroid Insecticide Screen

For the pyrethroid screen, a total of 16 QC samples were analyzed during the study period. Of those, 14 were blank-matrix spikes, and two were blind spikes. Recoveries for all of these samples were within the control limits.

## Metolachlor/degradates screen

For the metolachlor / metolachlor degradates screen, a total of 19 QC samples were analyzed during the study period. Of those, 17 were blank-matrix spikes, and two were blind spikes. Recoveries for all of these samples were within the control limits.

### OP screen

For the organophosphate screen, a total of 17 QC samples were analyzed during the study period. Of those, 14 were blank-matrix spikes, and three were blind spikes.

Chlorpyrifos, diazinon and malathion were detected at concentrations above the WQC (Table 17); all associated QC samples for these analytes were within control limits.

Two blank-matrix spike samples had several analytes with recoveries exceeding the upper control limits (UCL) only. No other OP QC samples had recoveries outside of the control limits. These two samples were the first OP QC samples analyzed at the start of the study, extracted on 7/3/2002 and 7/9/2002. The associated field samples analyzed with these QC samples were collected in the field on 7/2/2002 and 7/8/2002, respectively.

The analytes affected were the seven late-eluting compounds (see Appendix 3), dichlorvos, (7/9 QC sample only), phorate, fonofos, dimethoate, methyl parathion, tribufos, and profenofos. Dimethoate and methyl parathion were the only detections of these seven analytes in the 7/2 and 7/8 OP field samples. Because recoveries in both of the blank-matrix samples were greater than the UCL, the reported dimethoate and methyl parathion concentrations on these two dates may be biased upwards.

### Herbicide screen

Sixteen herbicide screen blank-matrix spike samples and two blind spike samples were analyzed throughout the study. Recoveries were generally within control limits; the exceptions are discussed below.

Recoveries of prometryn exceeded the lower control limit (LCL) in six blank-matrix spike samples. There were no detections of prometryn in the field samples associated with these QC samples. In these field samples, concentrations of prometryn may be slightly underestimated; however, given the low aquatic toxicity of this pesticide (Table 15), concentrations of significance would not have been undetected.

The UCL was exceeded for six of the 12 analytes in QC samples extracted on 8/13/2002 (atrazine, simazine, prometryn, DEA, DACT, and norflurazon). The field samples analyzed with this set were collected in the field on 8/5/2002 and 8/12/2002. None of the six were detected in the field samples analyzed with these QC samples.

The LCL was exceeded for bromacil in one blind spike sample. There were no detections of bromacil in any sample throughout the study. While the low recovery may indicate that concentrations in field samples could be slightly underestimated, it is unlikely that concentrations of toxicological significance would have remained undetected as a result.

The exceedances of the control limits in these analyses have no impact on the conclusions of the study.

## **Conclusion**

Chlorpyrifos, diazinon and malathion were detected at concentrations above established Water Quality Criteria. Although the frequency of detection of chlorpyrifos was not high, the insecticide was found during the summer irrigation season at concentrations potentially harmful to aquatic species at each of the sites sampled. Based on the WQC for chlorpyrifos and the relatively high reporting limit of the analytical method used in this study, even trace concentrations (as defined in this report) of this pesticide could pose a threat to aquatic organisms. A lower Reporting Limit/Method Detection Limit for chlorpyrifos is needed in order to assess more accurately how frequently the WQC are exceeded.

Diazinon and malathion were both detected infrequently. A single diazinon detection exceeded all three established WQC for diazinon. Malathion was detected in one sample, at 0.111  $\mu$ g/L. This concentration exceeds the U.S. EPA WQC of 0.1  $\mu$ g/L, but does not exceed the CDFG acute WQC of 0.43  $\mu$ g/L. Based on the data and criteria considered here, use of diazinon and malathion in this area during the summer irrigation season does

not appear to commonly result in concentrations that are harmful to the aquatic environment.

Although dimethoate, diuron and metolachlor were detected frequently (> 35% detection rate each), based on available toxicity data the concentrations detected did not have the potential to cause acute toxicity to aquatic organisms.

The authors are not aware of any existing aquatic toxicity test data for the metolachlor degradation products, metolachlor OXA and metolachlor ESA. These degradates were frequently detected in this study; nearly 70% of all samples collected had detections of at least one degradation product. In order to interpret the relevance of these detections, reliable aquatic toxicity information is needed.

The CDFG interim acute WQC of 0.03 µg/L for permethrin is below the RL of the analytical method used in this study. A more sensitive analytical method for permethrin is needed in order to assess more accurately how frequently the WQC are exceeded. Additionally, due to the hydrophobicity of the pyrethroid insecticides, steam bed sediment analysis should be considered in the design of future efforts to assess the potential impacts of these compounds on aquatic systems.

## **Acknowledgments**

We would like to thank the following for their contributions to this project:

Staff at CDPR, Environmental Monitoring Branch, especially Nina Bacey, Heather Casjens, Heather Imgrund, Adriana Moncada and Amy Washburn for sample collection/handling and Jesse Ybarra for technical assistance; Staff at the Center for Analytical Chemistry, CDFA, especially Catherine Cooper, Adriana Moncada, Janice Temple, Ryan Wichert and Teresa Woroneicka; Pat Dunn for early contributions to project formulation; Carissa Ganapathy for serving as the laboratory liaison.

# Appendix 1

Analytical Method: Analysis of pyrethroid insecticides by Gas Chromatography.

CALIFORNIA DEPT. OF FOOD & AGRICULTURE. Center for Analytical Chemistry Environmental Monitoring Section

3292 Meadowview Road Sacramento, Ca. 95832

(916) 262-2080,Fax (916) 262-2784

Method #: EM 52.5 Original Date: 09/07/00

Revised Date: Page 1 of 10

# DETERMINATION OF PERMETHRIN AND ESFENVALERATE / FENVALERATE IN SEDIMENT WATER

**Scope:** This method is for the determination of permethrin (cis and trans), esfenvalerate and its isomer fenvalerate in sediment water. The reporting limits of this method is 0.05 ppb for these compounds using the electron capture detector and 0.1 ppb using the mass selective detector.

**Principle:** The sediment water was extracted using hexanes. After concentrating the hexanes, the extracted residues were analyzed by gas chromatograph equipped with an electron capture detector (ECD) or by a mass selective detector (MSD). Permethrin was reported as the total of the cis and trans isomers and esfenvalerate was reported as the total of esfenvalerate and its isomer fenvalerate.

# Reagents:

- 1. Permethrin, CAS#52645-53-1, (combination of isomers cis and trans), 1.0 mg/mL in acetone, obtained from CDFA Standard Repository (Center for Analytical Chemistry, California Department of Food and Agriculture)
- 2. Fenvalerate, CAS#51630-58-1, (combination of isomers fenvalerate and esfenvalerate), 1.0 mg/mL in acetone, obtained from CDFA Standard Repository (Center for Analytical Chemistry, California Department of Food and Agriculture)
- 3. Hexanes, pesticide residue grade
- 4. Acetone, pesticide residue grade
- 5. Sodium sulfate, anhydrous granular (ACS)

### Safety:

Most of the reagents used and analyzed for in this method have not been completely characterized. All general laboratory safety rules must be followed.

# Equipment:

- 1. Separatory funnels, 2 L
- 2. Boiling flasks, flat bottom, 24/40 joints, 500 mL
- 3. Beakers, 1 L
- 4. Funnels, glass short stemmed 100 mm diameter
- 5. Rotary evaporator, Buchi/Brinkmann, R110

# Equipment: continued

- 6. Conical test tubes, graduated, calibrated 15 mL
- 7. Nitrogen evaporator, Organomation, Model 12

#### Instruments:

- 1. GC-ECD: Hewlett-Packard 5890 Gas Chromatograph equipped with an electron capture detector
- 2. GC/MSD: Hewlett-Packard 6890 Gas Chromatograph equipped with a series 5973 Mass Selective Detector

#### Interference:

The background had small peaks on the GC-ECD that fell close to the retention times of the compounds of interest but didn't interfere with the quanitation at this time. The MSD has no interferences at this time.

## Standard Preparation:

- 1. The 1mg/mL standards are diluted to 10ug/mL with acetone for spiking purpose.
- 2. Dilute the mg/mL standards into a series of desired standard sets that will be used for instrument calibration and sample calculation.
- 3. Keep all prepared standards in the designated refrigerator for storage while not in use.
- 4. The shelf life of each prepared standard is six months.

# Sample Preservation and Storage:

- 1. Check the temperature of samples upon arrival and record it.
- 2. Sign the chain of custody and obtain the EMON number.

#### Procedure:

- 1. Remove samples from the refrigerator and allow them to come to room temperature before weighing them. Record weight.
- 2. Transfer water sample to a 2 L separatory funnel leaving as much of the sediment as possible in the bottle.
- 3. Add 20 mL acetone to the bottle and shake for 10 seconds.
- 4. Add 100 mL hexanes to the bottle and shake for 30 seconds.
- 5. Pour acetone, hexanes and sediment to the separatory funnel and shake for 1 min.
- 5. After phase separation, drain water layer into a 1 L beaker then drain the hexanes layer through glass wool and ~ 45 g sodium sulfate into a 500 mL flask.
- 6. Pour the sample layer back into the separatory funnel.
- 7. Repeat the steps 3-6 two more times using 20 mL acetone and 80 mL hexanes.
- 8. Rinse the sodium sulfate with ~ 20 mL hexanes.
- 9. Weigh empty bottles and record the weight.
- 10. Rotoevaporate the extract to ~ 1 mL at 50 ° C under approximately 20 inches of Hg vacuum.
- 11. Transfer the extract to a 15 mL graduated test tube and rinse the flask twice with approximately 2 mL of hexane and add to the test tube.

#### **Procedure:** continued

12. Evaporate the extract to a final volume of 1 mL under a gentle stream of nitrogen in a 50 ° C waterbath. Vortex to mix well.

Preparation of blanks and Spikes

Blank: American River water with 5 grams of sediment added to the bottle. (Prepared by the Department of Pesticide Regulations)

Spike: Spike standard directly into the bottle containing American River water with 5 grams of sediment added. Mix well and let sediment settle before extracting.

### **Instrument Conditions:**

Instrument:

HP 5890 Gas Chromatograph equipped with an electron capture detector

Column:

HP-1 (Crosslinked methyl silicone gum) 30 m x 0.53 mm x 0.88 μm

Carrier gas:

Helium, 5 psi

Injector temperature: 220 °C Detector temperature: 300 °C Column oven temperature:

Initial temperature: 150 °C hold for 2 min.

Rate:

40 °C/min.

Final temperature: 280 °C for 20 min.

Injection volume: 1 µL

Retention times: Permethrin (cis & trans): ~10.3 & 10.4 minutes

Esfenvalerate (fenvalerate & esfenvalerate):~13.5 & 13.9 minutes

Instrument:

HP 6890 Gas Chromatograph equipped with a 5973 Mass Selective Detector

Column:

HP-5MS (5% Phenyl Methyl Siloxane), 30m x 0.25 mm x 0.25  $\mu$ m

Carrier:

Helium, 6.4 psi

Column oven temperature:

Initial temperature:

70 °C hold for 1.0 min.

Program Rate

25 °C/ min.

Final temperature:

280 °C hold for 8.00 min.

Injecture temperature:

250 °C

Transfer Line Temperature:

280 °C

Ions Selected for SIM Acquistion: Permethrin cis 163, 165, 183, 184

Permethrin trans 163, 165, 183, 184

Fenvalerate 181, 225, 419 Esfenvalerate 181, 225, 419

Retention times:

Permethrin cis ~12.5 minutes

Permethrin trans ~12.6 minutes Fenvalerate ~15.1 minutes Esfenvalerate~15.4 minutes

Volume Injected: 2 µL

## **Instrument Calibration:**

- 1. Load a method, set the desired condition for analysis.
- 2. Run 0.05, 0.1, 0.25, and 0.5 ηg/uL to check the system linearity

# Analysis:

# Quality Control:

- 1. A 4-point calibration curve of 0.05, 0.1, 0.25 and 0.5 ηg/uL for permethrin and esfenvalerate/fenvalerate were obtained at the beginning and the end of each set of samples.
- 2. Each sample shall be injected two times to insure reliability of the analysis. Results obtained using a calibration curve shall lie within the range of the calibration curve. If results fall outside the calibration curve, the sample must be concentrated/diluted or the calibration curve extended. A sample set is usually comprised of 10 samples, a blank and a spike.

# Method Detection Limit (MDL):

Method Detection Limit (MDL) refers to the lowest concentration of analyte that a method can detect reliably in either a sample or a blank. To determine the MDL, spike 7 samples, with 0.1 ppb of permethrin and esfenvalerate/fenvalerate and process through the entire method along with a blank. The standard deviation derived from the 7 spike results was used to calculate the MDL using the following equation:

MDL = tS

Where:

t = the student "t" value for the 99% confidence level with n-1 degrees of freedom (t=3.143 for 6 degrees of freedom). n= the number of replicates.

S = the standard deviation obtained from the 7 replicates analysis

The results for the standard deviations and MDL are in Appendix 1.

#### Reporting Limit (RL):

RL refers to level above which quantitative results may be obtained. The MDL was used as a guide to determine the RL. The reporting limit is 0.05 ppb for permethrin and esfenvalerate/fenvalerate using the ECD and 0.1ppb for permethrin and esfenvalerate/fenvalerate using the MSD.

# Recovery Data:

The analytical method was validated using five sets of spike samples. Each set contained a blank and five levels of spikes. Each set was processed through the entire analytical method. Recoveries of permthrin and esfenvalerate/fenvalerate are shown in Appendix 2.

#### Calculations:

(peak ht sample)(response factor, 
$$\eta g$$
) (sample final volume, mL)(1000  $\mu L/mL$ )

ppb =

(sample vol. Injected, µL)

Calculations: continued

 $[ (std. Conc.n, \eta g / \mu L) (std. Vol. Injected, \mu L) / (std. Peak ht..n) ]$ where: response factor( $\eta g$ ) =

n=number of standards

# Acceptance Criteria:

1. The standard curves at the beginning and end of each sample set should not have a percent change greater than 10 % for the ECD and 20% for the MSD. The % change in response was calculated as follows:

% Change in response = absolute value of [response of (std before - std after)/ std before] x 100

2. The samples were calculated using the response factor average of the curves. If the results between the two injections differ less than 10 % for ECD and 15 % for MSD either result can be reported. A change greater than 10 % for ECD and 15 % for MSD with no known reason requires a third injection.

Discussion: In this project a storage stability study was done. The storage stability study consisted of 0.5 ppb spike level and 3 replicates over a 13 day period. The spiked samples were stored in the refrigerator and then analyzed on days 0, 3, 5, 7, 10, and finally with day 13. It was noticed that by day 3 the esfenvalerate spike had started to transform to its isomer fenvalerate. At the beginning of this project we were just going to analyze for esfenvalerate since that was the analyte being applied in the environment. However, after the transformation of the esfenvalerate to it's isomer fenvalerate it was decided to add the two together and report the total. All the mdl and validation data was recalculated to report the total of fenvalerate and esfenvalerate. A new standard was prepare using fenvalerate which is a ratio of approximately 60% fenvalerate to 40% esfenvalerate, compared to the esfenvalerate standard which was approximately 10% fenvalerate to 90% esfenvalerate. It was also noticed that permethrin over the 13 day storage study showed a little degradation. The results for the storage stability study are shown in appendix 3.

The results for the GC-ECD were calculated using height to minimize any interferences that might be caused by the background. The background had small peaks that fell close to the retention times of the compounds permethrin cis and trans, but didn't interfere with quanitation at this time. The MSD has no interferences.

# Determination of Residues of Alachlor and Metolachlor and Selected Metabolites in Surface Water by Liquid Chromatography-Mass Spectrometry

Scope: This method is for the determination of the residues of Alachlor and Metolachlor and selected metabolites in surface water. These metabolites are ((2-ethyl-6-methylphenyl) (2-methoxy-1-methylethyl)amino) oxo-acetic acid, ((2-ethyl-6-methylphenyl) (2-methoxy-1-methylethyl)amino) 2-oxo-ethanesulfonic acid, ((2,6 diethylphenyl) (methoxymethy)amino) oxo-acetic acid, and ((2,6-diethyl phenyl) (methoxymethyl)amino) 2-oxo-ethanesulfonic acid. These six compounds are analyzed by liquid chromatography with a C-8 reverse phase column with ion trap mass spectrometry in MS/MS mode The reporting limit is 0.05 μg/L for all compounds. The lowest validated spiking level is 0.1 μg/L for all compounds in surface water. The lowest amount standard injected is 0.5 ng, 50 μL of 0.01 ng/μL, for all compounds.

**Principle:** A 150 mL aliquot of filtered surface water is passed through a C-18 solid phase extraction columns (1 g). The analytes and the adsorbed water are eluted with methanol. The methanol is evaporated at 45 °C with a gentle stream of nitrogen to just below 0.4 mL. A 0.1 mL acetonitrile is added and the final extract volume is adjusted to 0.5 mL with water. The extract is analyzed by LC/MS/MS using a C-8 column and acidified mobile phase. All metabolites are analyzed using ESI negative ion mode. The residues of Alachlor and Metolachlor are analyzed using APCI positive ion mode.

# **Definitions not in Glossary:**

### Reagents:

Use residue grade solvents for sample extraction and ultra pure grade solvents (Burdick & Jackson or equivalent) and reagents for HPLC elution and Mass Spectrometry detection.

- 1. Alachlor, CAS # 015972-60-8, 1.0 mg/mL in methanol, provided by the Standards Repository, Center for Analytical Chemistry, California Department of Food and Agriculture.
- 2. Metolachlor, CAS #051218-45-2, 1.0 mg/mL in methanol, provided by the Standards Repository, Center for Analytical Chemistry, California Department of Food and Agriculture

- 3. Metolachlor OXA, CAS #152019-73-3, 1.0 mg/mL in water, provided by the Standards Repository, Center for Analytical Chemistry, California Department of Food and Agriculture, its chemical name is ((2-ethyl-6-methylphenyl) (2-methoxy-1-methylethyl)amino) oxo-acetic acid.
- 4. Metolachlor ESA, CAS # not known, 1.0 mg/mL in water, provided by the Standards Repository, Center for Analytical Chemistry, California Department of Food and Agriculture, its chemical name is ((2-ethyl-6-methylphenyl) (2-methoxy-1-methylethyl)amino) 2-oxo-ethanesulfonic acid
- 5. Alachlor ESA, CAS # not known, 1.0 mg/mL in water, provided by the Standards Repository, Center for Analytical Chemistry, California Department of Food and Agriculture, its chemical name is ((2,6-diethyl phenyl) (methoxymethyl)amino) 2-oxoethanesulfonic acid
- 6. Alachlor OXA, CAS # not known, 1.0 mg/mL in water, provided by the Standards Repository, Center for Analytical Chemistry, California Department of Food and Agriculture its chemical name is (2,6 diethylphenyl) (methoxymethy)amino) oxo-acetic acid
- 7. Methanol, ultra pure grade from Burdick & Jackson, Cat #230-4 or equivalent
- 8. Acetonitrile, ultra pure grade from Burdick & Jackson, Cat #018-04 or equivalent
- 9. Water, ultra pure grade, Burdick & Jackson, Cat #365-4 or equivalent
- 10. Acetic acid, HPLC grade Fisher Cat #A35-500 or equivalent
- 11. Acrodisc® 0.2 μm, Gelman Laboratory, Cat # 09730191.
- 12. C-18 Solid phase extraction cartridge (1g), Waters Sep-Pak Vac 6 cc, Part #36905 or equivalent
- 13. Glass fiber filter, Gilman, 47 mm, capable retain particles larger than 1 micron

#### Safety:

No known carcinogens are used in this method. All general laboratory safety procedures must be followed (e.g. wear safety glasses, gloves, use ventilation hood, etc...)

### Equipment:

- 1. Vacuum manifold, in-house system with multi-channels, a 1 liter glass filtration device attached to each channel.
- 2. Vacuum manifold, Supelco 24 port model, Cat # 913-0445
- 3. Larger Volume Sampler, Supelco, Cat #57275
- 4. Vacuum pump or in-house vacuum, at least 25 inches vacuum
- 5. Balance, analytical
- 6. Graduated cylinders
- 7. Nylon Acrodisc, 0.2 um, Gelman, Part #4436
- 8. Graduated conical test tube, 15 mL, calibrated for 0.5 mL
- 9. Nitrogen evaporator, Organomation, Model 112
- 10. Vortex mixer, Fisher Scientific, Model Vortex-Genie 2
- 11. Autosampler vial, Waters total recovery vial, 12X32mm and cap with preslit PTFE/Silicon septa, Part #186000385

# **Instrument:** (see detail in operating parameters)

- 1. HPLC with autosampler and column oven
- 2. Mass spectrometer

3. Computer

#### Interference:

The MS/MS detection of all these analytes is specific. Multiple factors are used to eliminate possible interferences. The factors are parent mass (M-H), or (M+H) and specific daughter ions:

	Parent mass m/z	Parent ion	Daughter ions m/z
Alachlor OXA	264	(M-H)-	192, 160
Alachlor ESA	314	(M-H)-	121
Metolachlor OXA	278	(M-H)-	206
Metolachlor ESA	328	(M-H)-	121, 192
Alachlor	270	$(M+H)^+$	238
Metolachlor	284	$(M+H)^+$	252

# Standard Preparation:

The individual stock standards of 1.0 mg/mL are obtained from the Standards Repository, CAC, CDFA. They obtained the neat standards from either the manufactures or from commericial supplers of standards. The individual stock solution of alachlor and metolachlor are prepared in methanol. The individual stock solutions of the four metabolites are prepared in water. They are sealed in ampules and are stored in a refrigerator (less than 5 °C). The working standards of the four metabolites and the two parent compounds are combined and prepared by mixing equal amount of stock solutions, then diluted with a mixtutre of water and acetonitrile (80/20) to the following concentrations: 0.5, 0.2, 0.1, 0.05, 0.02 and 0.01 ng/μL The lowest standard required for the standard curve is 0.017 ng/μL. This concentration equals to the reporting limit of 0.05 ppb.

# Sample Preservation and storage:

Check and record sample temperature upon arrival. Store all samples in a locked designated area in the walk-in refrigerator (less than 5 °C). Return samples to the refrigerator immediately after subsample is taken.

### Sample Extraction:

- 1. Measure 200±0.1 gram surface water into a 500 mL beaker. Do sample spike at this step, if required (such as for MDL, method validation, and continuing QC).
- 2. Set up a multi-channel vacuum manifold with one liter glass filtration device attached to each channel. Use 47 mm Gelman type A/E glass fiber filter for filtration.
- 3. Filter the 200 mL sample through the glass fiber filter.
- 4. Measure 150±0.1 gram of the filtered subsample.
- 5. Set up a Supelco 24 channels manifold extraction device.

- 6. Connect a C-18 SPE columns (1 gram) to each channel. Turn off the unused channels of the manifold. Pre-condition the SPE columns by passing 10 mL of methanol followed by 20 mL of D.I. water. Do not allow the columns to go dry.
- 7. Apply the sample at the rate of 5-10 mL per minute by adjusting the vacuum. The typical operating pressure is about 10-15 inch Hg. Maintain at least 1 cm water level in the column until all sample has passed through the cartridge.
- 8. As soon as the sample has passed through the column, rinse the beaker with 10 mL of D.I. water and continue the extraction until all the rinsate has passed through the columns. Make sure all the columns are properly labeled before disconnecting them.
- 9. Remove the sampling tube. Apply a 25 inches vacuum for 5 minutes to allow excess water to be removed.
- 10. Elute the columns with 10 mL methanol and collecte into a 15 mL graduated conical centrifuge tube. Filter the solution through a 0.2 micron Acrodisc and rinse the tube with 2 mL methanol. Pass the rinsate through the same Acrodisc filter and combine the filtrates
- 11. Evaporate the eluant in a water bath at 45 °C with a gentle stream of nitrogen. Continue the evaporation to just 0.4 mL. Further evaporation will result in a significant low recovery of Alachlor.
- 12. Add 0.1 mL of acetonitrile and vortex for 20 seconds. Add water to a final volume of 0.50 mL and vortex for 15 seconds.
- 13. Transfer the entire content to a Waters total recovery autosampler vial.

# **Equipment Conditions:**

## 1. HPLC System and Operating Parameters

Instrument: Waters Model 2690 HPLC, gradient pump, autosampler, column heater with

remote control through the Finnigan Xcalibur system

Detector: Finnigan LCQ Deca Mass spectrometer

Column: Zorbax SB-C8 4.6 x 150mm 3.5 Micron (part number: Agilent 863953-906)

Precolumn: Phenomenex C-18 4 mm L x 2.0 mm ID cartridge (part number: AJO-4286)

Column Temperature: 40 °C

Solvent: Isocratic: 65% solvent A and 35 % solvent B,

Solvent A: 0.1% acetic acid in methanol (Burdick & Jackson or equivalent)

Solvent B: 0.1% acetic acid in ultra pure water (Burdick & Jackson or equivalent)

Note: A gradient mobile phase profile with the same column and the same mobile phase also works, and the retention times change accordingly, although the separations are not significantly improved. However, the retention time consistency is improved. The parameters of the modification are listed in the table 7 and the verification

spike/recovery data of the modified method is listed in the table 8.

Flow rate: 0.6 mL/min Injection volume: 50 µL

Retention time: Alachlor OXA: 8.5 min

Alachlor ESA:

8.8 min

Metolachlor OXA:

9.6 min

Metolachlor ESA:

9.23 min

Alachlor

11.50 min

Metolachlor

12.50 min

Note: An alternative C-8 column or other reversed phase column will probably work. The retention times may be different.

The retention times listed above are for reference only. The retention times of alachlor and metolachlor are consistent. But the retention times of the metabolites are not very consistent. It probably due to the high polarity of the metabolites and the large volume injection.

# 2. Mass Spectrometry System and Operating Parameters:

#### Instrumentation:

Finnigan LCQ Deca, ion trap mass spectrometer with ESI ion in negative ion mode for the analysis of metabolites and with APCI ion source in positive ion mode for the analysis of Alachlor and Metolachlor.

Instrument control and data handling: Gateway computer model E-4200 with 10 MB hard disk.

Software: Xcalibur Version 1 SR1.

#### Tune Methods:

Table 3 for ESI tune methods
Table 5 for APCI tune method

#### Instrument Method:

Table 4 for ESI instrument methods
Table 6 for APCI instrument method

MS Detector Settings: ESI ion source and negative mode for the analysis of the metabolites.

APCI ion source and positive mode for the analysis of the parent

compounds.

#### **Instrument Calibration:**

A 6 level standard curve is run before and after each sample set. The concentration of working standards are 0.01, 0.02, 0.05, 0.1, 0.2 and 0.5 ng/ $\mu$ L and the injection volume is 50  $\mu$ L.

### Analysis:

Build a sequence table and inject the first standard at least twice to condition the instrument. Input the correct dilution factors. The typical sequence order is standards, blank, spikes, 10 samples and standards, then repeat the order for the second injection.

### Calculations:

Calculate the concentration of chemical(s) of a sample as follows:

The LCQuan software in Xcalibur is used for calculations.

In general, std vol. injected = sample vol. injected.

final volume =0.50 mL sample vol.= 150 mL

The ions used for calculation are listed in the following table

Analytes	Ions used for calculation
Alachlor	238
Metolachlor	252
Alachlor OXA	192,160
Alachlor ESA	121,160
Metolachlor OXA	206
MetolachlorESA	121,192

#### **Method Performance:**

### Method Detection Limit:

Method Detection Limit (MDL) refers to the lowest concentration of analytes that a method can detect reliably in either a sample or blank. To determine the MDL, each of the 7 samples containing 200 mL of background American River water supplied by DPR (matrix blank) were spiked separately with 0.1  $\mu$ g/L (15 ng) of Alachlor OXA, Alachlor ESA, Metolachlor OXA and Metolachlor ESA, Alachlor and Metolachlor. These spiked samples along with a blank were analyzed using the described method. The standard deviation derived from the analytical results of the 7 spiked samples was used to calculate the MDL using the following equation:

$$MDL = t S$$

where:

t is the Student 't' value for the 99% confidence level with n-1 degrees of freedom (n-1, 1 -  $\alpha$  = 0.99). n represents the number of replicates.

S denotes the standard deviation obtained from replicate analyses.

# Reporting Limit:

Report Limit (RL) refers to the level above which quantitative results may be obtained usually 1-5 times the MDL. In this case, the reporting limit is  $0.05~\mu g/L$  for all six compounds.

# Spiking solution and spiking volume:

MDL, method validation and QC spikes are made by spiking 200.0 mL of background surface water obtained for this study, which is from the American River.

The concentration of mixed standard for spiking is  $1.0 \text{ ng/}\mu\text{L}$  and  $30.0 \text{ ng/}\mu\text{L}$  for all six compounds. The volumes spiked are as in the following table.

	Sample Size (mL)	Volume Added (μL)		Analyte Spiked (ng)	Equivalent to (μg/L)
Spiking Solution		1.0 ng/μL	30 ng/μL		
MDL	200	20 ·		20	0.1
Validation level 1	200	20		20	0.1
Validation level 2	200	40		40	0.2
Validation level 3	200	100 🗳		100	0.5
Validation level 4	200		6.66	200	1.0
Validation level 5	200		13.3	400	2.0
Set QC	200	60		60	0.3

#### MDL Data:

Table 1

### Method Validation Data:

Table 2

### Acceptance Criteria:

- 1. The standard curves at the beginning and end of each sample set should not have a percent change greater than 20%. The % change in response is calculated as follows:
  - % Change in response = absolute value of [slope of (STD curve before STD curve after)/ STD curve before] x 10
- 2. The sample results are calculated based on the average of two adjacent calibration curves using Xcalibur software.
- 3. The R<sup>2</sup> of each calibration shall be larger than 0.990
- 4. The recoveries of the spike recovery shall be within the control limit
- 5. When the above criteria meet, the chemist may report the average of the two injections.

### Discussion:

In the beginning, we developed the parameters of analysis for these metabolites with a used C-18 column. As we changed to an identical new column to run the analysis, the method did not work. The reason is unknown. A renewed effort to use a C-8 column and an isocratic mobile phase, as described in this method, provide us with acceptable results.

We presented two instrument methods for determination of the metabolites. One method does not always meet the acceptance criteria for all analytes. When this happens we run the second method.

It was a difficult task to develop a method to analyze these highly water soluble acidic compounds. In order to get an acceptable chromatogram, addition of acid into the mobile phase is necessary, but too much acid reduces the negative ion ionization. We found that 0.1 % acetic acid in mobile phase gives good chromatograms and the required sensitivity.

The evaporation step, in the sample preparation section (step 9), to reduce the volume to 0.4 mL is critical. We experienced a significant low recovery of Alachlor and slightly low recovery of Metolachlor, if the evaporation continues.

We chose to use isocratic elution in the HPLC operation, which provides us a wide, but symmetrical bell shape peak and stable response. It also provides us more data points across each peak and reproducible results. Later, we found the retention time shift significantly between standards and samples. In order to reduce the retention shifting problem, I tried to use gradient with large amount aqueous in the beginning of sample introduction and return to isocratic in 4 minutes. The change has been verified. (See Tables 7 and 8)

In order to achieve sensitivity and stable response, we have to analyze Alachlor and Metolachlor with APCI ion source and their metabolites with ESI ion source.

This method provides acceptable results, as measured by the average recovery at all spiking level for all six analytes. No residues or interferences are found in background water

Chromatography

EMON-SM-46.0 Revision: Revision Date: Original Date: 10/10/2002 Page 1 of 16

Title: Determination of Organophosphate Pesticides in Surface water using Gas

# 1. Scope:

This section method (SM) documents the selected organophosphate pesticides analysis in surface water by all authorized section personnel.

# 2. Principle:

The surface water sample is extracted with methylene chloride. The extract is passed through sodium sulfate to remove residual water. The anhydrous extract is evaporated to almost dryness on a rotary evaporator and diluted to a final volume of 1.0 mL with acetone. The extract is then analyzed by a gas chromatograph equipped with flame photometric detector (FPD) and any positive result is confirmed by mass selective detector (MSD).

# 3. Safety:

- 3.1 All general laboratory safety rules for sample preparation and analysis shall be followed.
- 3.2 Methylene chloride is a regulated and controlled carcinogenic hazardous substance. It must be stored and handled in accordance with California Code of Regulations, Title 8, Subchapter 7, Group 16, Article 110, Section 5202.
- 3.3 All solvents should be handled with care in a ventilated area.

### 4. Interferences:

There are matrix interferences that cause quantitative problems. Therefore the calibration standards will be made up in appropriate matrix.

# 5. Apparatus and Equipment:

- 5.1 Rotary evaporator (Büchi/Brinkman or equivalent)
- 5.2 Nitrogen evaporator (Meyer N-EVAP Organomation Model # 112 or equivalent)
- 5.3 Vortex-vibrating mixer
- 5.4 Balance (Mettler PC 4400) or equivalent

EMON-SM-46.0 Revision: Revision Date: Original Date: 10/10/2002

Page 2 of 16

- 5.5 Gas Chromatograph equipped with a flame photometric detector (FPD) in phosphorus mode
- 5.6 Gas Chromatograph equipped with mass selective detector(MSD)

# 6. Reagents and Supplies

- 6.1 Methylene Chloride, nanograde or equivalent pesticide grade
- 6.2 Acetone, nanograde or equivalent pesticide grade
- 6.3 Anhydrous Sodium Sulfate, granular
- 6.4 Ethoprophos CAS# 13194-48-4 6.5 Diazinon CAS# 333-41-5 6.6 Disulfoton CAS# 298-04-4 6.7 Chlorpyrifos CAS# 2921-88-2 6.8 Malathion CAS# 121-75-5 6.9 Methidation CAS# 950-37-8 6.10 Fenamiphos CAS# 22224-92-6 6.11 Azinphos Methyl CAS# 86-50-0 6.12 Dichlorvos CAS# 62-73-7 6.13 Phorate CAS# 298-02-2 6.14 Fonofos CAS# 66767-39-3 6.15 Dimethoate CAS# 60-51-5
- 6.16 Parathion methyl CAS# 298-00-0 6.17 Tribufos (DEF) CAS# 13071-79-9
- 6.18 Profenofos CAS# 41198-08-7
- 6.19 Conical tube with glass stopper, 15-mL graduated, 0.1 mL subdivision
- 6.20 Separatory funnel, 2 L
- 6.21 Boiling flask, 500 mL
- 6.22 Whatman filter paper, #4, 15 cm
- 6.23 Funnel, long stem, 10 mm diameter
- 6.24 Disposable Pasteur pipettes, and other laboratory ware as needed
- 6.25 Recommended analytical columns:

For FPD – Restek's Rtx® - OPPesticides (fused silica column), 30 m x 0.25 mm x 0.4 μm film thickness or 30 m x 0.32 mm x 0.5 μm film thickness, and Rtx® -OPPesticides2 (fused silica column), 30 m x 0.25 mm x 0.25 μm film thickness or 30 m x 0.32 mm x 0.32  $\mu$ m film thickness.

For MSD - 5% phenyl Methylsilicone (HP-5ms or equivalent) fused silica column, 30 m x 0.25 mm x 0.25 µm film thickness.

EMON-SM-46.0 Revision: Revision Date: Original Date: 10/10/2002 Page 3 of 16

# 7. Standards Preparation:

- 7.1 Dilute the 1 mg/mL Organophosphate standards obtained from the CDFA/CAC Standards Repository with acetone to make up a series of mixed working standards(see 10.2). These standards shall be prepared to cover the linear range from 0.025 ηg/μL to 0.5 ηg/μL.
- 7.2 The calibration standards are added to matrix blank extracts (9.1.2.1) to correct for matrix background interference.
- 7.3 Keep all standards in designated refrigerator for storage.
- 7.4 The expiration date of each mixed working standard is six months from the preparation date.
- 8. Sample Preservation and Storage:

All water samples and sample extracts shall be stored in the refrigerator (32-40 °F).

- 9. Test Sample Preparation:
  - 9.1 Sample Preparation
    - 9.1.1 Remove samples from refrigerator and allow samples to come to room temperature before extraction.
    - 9.1.2 Preparation of matrix blank and matrix spike:

The Department of Pesticide Regulations (DPR) provide the background water for matrix blank and spikes.

- 9.1.2.1 Matrix blank: Weigh out 1000 g of background water and follow the test sample extraction procedure.
- 9.1.2.2 Matrix spike: Weigh out 1000 g of background water. Spike a client requested amount of organophosphate pesticides into the background water and let it stand for 1 minute. Follow the test sample extraction procedure.

EMON-SM-46.0 Revision: Revision Date: Original Date: 10/10/2002 Page 4 of 16

# 9.2 Test Sample Extraction

- 9.2.1 Record the weight of water by subtracting the weight of the sample container before and after water has been transferred into a separatory funnel.
- 9.2.2 Shake with 100 mL of methylene chloride for 2 minutes. Vent frequently to relieve pressure.
- 9.2.3 After phases have separated, drain lower methylene chloride layer through 20 g of anhydrous sodium sulfate, into a 500 mL boiling flask.
- 9.2.4 Repeat steps 9.2.2 & 9.2.3 two more times using 80 mL of methylene chloride each time. Combine the extracts in the same boiling flask.
- 9.2.5 After draining the final extraction, rinse the sodium sulfate with 25 mL of methylene chloride.
- 9.2.6 Evaporate the sample extract to ~ 3 mL on a rotary evaporator using a water bath at ~ 35 °C and ~ 15 - 20 inch Hg vacuum. Add ~ 3 mL of acetone and rotoevaporate to 1 - 2 mL. Transfer the extract to a calibrated 15 mL graduated test tube.
- 9.2.7 Rinse flask 3 more times with 3 mL of acetone and transfer each rinse to the same test tube.
- 9.2.8 Evaporate the extract to a volume slightly less than 1 mL in a water bath at 25 to 35 °C under a gentle stream of nitrogen. Then bring to a final volume of 1 mL with acetone, mix well and transfer into two autosampler vials.
- 9.2.9 Submit extract for GC analysis.

#### 10. Instrument Calibration:

- 10.1 The calibration standards are added to a matrix blank extract to correct for matrix background interference.
- 10.2 A calibration standard curve consists of minimum of three levels. The concentration of 0.025, 0.05, 0.1, 0.25, 0.5 or 1.0 ηg/μL standards are recommended. Calibration is obtained using a linear or quadratic regression with the correlation coefficient ( r ) equal to or greater than 0.995.

EMON-SM-46.0 Revision: Revision Date:

Original Date: 10/10/2002

Page 5 of 16

10.3 Suggested composition of calibration mixed standards are as follow.

OP-1 Mixed Standard

Ethoprophos Diazinon

Disulfoton

Chlorpyifos

Malathion

Methidathion

Fenamiphos

Azinphos-methyl

**OP-2 Mixed Standard** 

Dichlorvos

Phorate

Fonofos

Dimethoate

Parthion-methyl

DEF

Profenofos

# 11. Analysis:

# 11.1 Injection Scheme

Follow the sequence of Solvent, Calibration standards, Solvent, Matrix Bank, Matrix Spike, Test Samples (maximum of 10-12 samples) and Calibration standards. Inject an old sample or matrix blank before the sequence analysis to condition the instrument is recommended.

# 11.2 GC Instrumentation

- 11.2.1 Analyze OP pesticides by a gas chromatograph equipped with two flame photometric detectors and two different columns.
- 11.2.2 Recommended instrument (GC/FPD) parameters: Injector 250 °C; detector 250 °C; oven temperature 80 °C (hold 2 min.) to 180 °C @ 20 °C/min. to 280 °C @ 6 °C/min. (hold 6 min.); injection volume 4 µL.
- 11.2.3 Confirm OP pesticides by a gas chromatograph equipped with mass selective detector.
- 11.2.4 Recommended instrument (GC/MSD) parameters: Injector 250 °C; MSD transfer line heater 280 °C; oven temperature 70 °C (hold 1 min.) to 190 °C @ 15 °C/min.(hold 2 min.) to 250 °C@ 15 °C/min. (hold 6 min.); injection volume 4 μL.

EMON-SM-46.0 Revision: Revision Date: Original Date: 10/10/2002 Page 6 of 16

# 12. Quality Control:

- 12.1 Each set of samples shall have a matrix blank and minimum of one matrix spike sample.
- 12.2 The matrix blank shall be free of target compounds.
- 12.3 The recoveries of the matrix spike should be within the control limits.
- 12.4 The retention time shall be within  $\pm$  2 per cent of that of the standard.
- 12.5 The sample must be diluted if results fall outside the linear range of the standard curve.
- 12.6 Bracketing standard curves should have a percent change less than 15 % for most of organophosphate compounds, and 20 – 25 % for late eluted OP compounds.
- 12.7 Method Detection Limits (MDL)

The method detection limit refers to the lowest concentration of analyte that a method can detect reliably. To determine the MDL, 7 replicate water samples are spiked at 0.05 ppb. The standard deviation from the spiked sample recoveries are used to calculate the MDL for each analyte using the follow equation:

MDL = tS

Where t is the Student t test value for the 99% confidence level with n-1 degrees of freedom and S denotes the standard deviation obtained from n replicate analyses. For the n=7 replicate used to determine the MDL, t=3.143.

# 12.8 Reporting limit (RL):

The reporting limit (RL) refers to the level at which reliable quantitative results may be obtained. The MDL is used as a guide to determine the RL. Agreed upon per client agreement, the RL is chosen in a range 1-5 times the MDL.

MDL data and the RL are tabulated in Appendix I.

EMON-SM-46.0 Revision: Revision Date: Original Date: 10/10/2002

Page 7 of 16

- 12.9 Method Validation Recovery Data and Control Limits:
  - 12.9.1 The method validation consisted of five samples sets. Each set included seven levels of fortification (0.05, 0.1, 0.25, 0.5, 1.0, 2.0, and 5.0 ppb) and a method blank. All spikes and method blank samples were processed through the entire analytical method.
  - 12.9.2 Upper and lower warning and control limits are set at  $\pm$  2 and 3 standard deviations of the average % recovery, respectively.

Method validation results and control limits are tabulated in Appendix II.

### 13. Calculations:

Quantitation is based on external standard (ESTD) calculation using either the peak area or height. The software uses a linear or quadratic curve fit, with all levels weighted equally. Alternatively, at chemist discretion, concentrations may be calculated using the response factor for the standard whose value is closest to the level in the sample.

# 14. Reporting Procedure:

# 14.1 Identification of Analyte

For responses within calibration range, compare the retention time of the peaks with the retention time of standards. For positive results retention times shall not vary from the standards more than 2 percent.

14.2 The Restek's Rtx® - OPPesticides column is used as the primary analytical column, the 2<sup>nd</sup> column, Rtx® - OPPesticides2 column and GC/MSD used as confirmation.

Sample results and the data reported in the Appendix I and II were calculated from the Rtx® - OPPesticides column.

EMON-SM-46.0 Revision: Revision Date: Original Date: 10/10/2002 Page 8 of 16

14.3 Sample results are reported out according to the client's analytical laboratory specification sheet.

#### 15. Discussion and References:

- 15.1 Sample response and quantitation vary depending on matrix background in the samples. The calibration standards were added to a matrix blank extract to correct for matrix background interference.
- 15.2 Two different sizes of analytical column (ID of 0.25 and 0.32 mm) were used in this method. The column with larger ID (0.32 mm) seems to give more reproducible results, since 4  $\mu$ L sample extract was injected.
  - The retention times for OP pesticides are tabulated in Appendix III.
- 15.3 Some of the late eluting compounds were observed to suffer gradual losses in sensitivity. We recommend changing the injector liner and trimming the column when this occurs.

Analytical Method: Analysis of herbicides by Liquid Chromatography/Mass Spectrometry.

CALIFORNIA DEPT. OF FOOD & AGRICULTURE Center for Analytical Chemistry Environmental Monitoring Section 3292 Meadowview Road Sacramento, CA 95832 (916) 262-2080 Fax (916) 262-1572 Method #: 62.9 Original Date: 7/21/1999 Revised: Page 1 of 38

Determination of Atrazine, Bromacil, Cyanazine, Diuron, Hexazinone, Metribuzin, Norflurazon, Prometon, Prometryn, Simazine, Deethyl Atrazine (DEA), Deisopropyl Atrazine (ACET), and Diamino Chlorotriazine (DACT) in Well Water By Liquid Chromatography-Atmospheric Pressure Chemical Ionization Mass Spectrometry

Scope: This method is applicable to analysis of Atrazine, Bromacil, Cyanazine, Diuron, Hexazinone, Metribuzin, Norflurazon, Prometon, Prometryn, Simazine, Deethyl Atrazine (DEA), Deisopropyl Atrazine (ACET), and Diamino Chlorotriazine (DACT) in well water using two different HPLC columns. Data obtained from these two columns are presented in this method. The reporting limit for all chemicals is 0.05 μg/g with APCI/LCMS/MS instrument.

**Principle:** Two conditioned Waters Oasis<sup>®</sup>MCX Cartridges connected in tandem are used to retain the analytes from well water samples. The cartridges are placed under vacuum to eliminate any remaining water. The chemicals are eluted with 5% ammonium hydroxide in methanol. The eluant is then filtered, concentrated, reconstituted in 75/25 water / methanol and analyzed by APCI/LC/MS/MS. Two different HPLC columns have been validated to provide flexibility to the analyst, and to provide a means of confirmation for samples that have matrix interferences which are not present in the reference well water used for the validations.

# Reagents, Equipment and Instruments:

### Reagents:

- 1. Methanol, LCQ grade. Burdick & Jackson 230-4.
- 2. Distilled water, LCQ grade. Burdick & Jackson 365-4. Burdick & Jackson solvents are available from VWR and other suppliers.
- 3. Formic acid.
- 4. Ammonium formate.
- 5. Ammonium hydroxide.
- 6. Elution reagent: 5% ammonium hydroxide in methanol.
- 7. Reconstitution reagent: 75/25 water / methanol.
- 8. Mobil phase A: 95/5 (10 mM ammonium formate/methanol), 0.1% formic acid. For 500 mL, mix  $470 \pm 2$  mL Burdick & Jackson water,  $25 \pm 0.5$  mL Burdick & Jackson methanol,  $4.50 \pm 0.25$  mL 1 M ammonium formate, and  $0.5 \pm 0.05$  mL formic acid. Double these quantities to prepare 1L.
- 9. Mobil phase B: 90/10 (methanol/0.1 M ammonium formate), 0.1% formic acid For 500 mL, mix 450 ± 2 mL Burdick & Jackson methanol and 45 ± 0.5 mL Burdick & Jackson water with 4.5 ± 0.25 mL of 1 M ammonium formate and 0.5 ± 0.05 mL of formic acid. Double these quantities to prepare 1L.
- 10. Working standards in 75/25 water / methanol (diluted from stock standards). Note: The highest available purity reagents (1,2,3,4,5) should be specified when ordering.

Determination of Atrazine, Bromacil, Cyanazine, Diuron, Hexazinone, Metribuzin, Norflurazon, Prometon, Prometryn, Simazine, Deethyl Atrazine (DEA), Deisopropyl Atrazine (ACET), and Diamino Chlorotriazine (DACT) in Well Water By Liquid Chromatography-Atmospheric Pressure Chemical Ionization Mass Spectrometry

Reagents: (cont.)

<u>Chemicals</u>	CAS Registry Numbers
Diamino Chlorotriazine (DACT)	3397-62-4
Deisopropyl Atrazine (ACET)	11007-28-9
Deethyl Atrazine (DEA)	6190-65-4
Metribuzin	21087-64-9
Bromacil	314-40-9
Atrazine	1912-24-9
Norflurazon	27314-13-2
Cyanazine	21725-46-2
Simazine	122-34-9
Hexazinone	51235-04-2
Diuron	330-54-1
Prometon	1610-18-0
Prometryn	7287-19-6
Propazine	139-40-2
Trietazine	1912-26-1

# Equipment:

- 1. In-house vacuum manifold.
- 2. Solid phase extraction cartridges: Waters Oasis® MCX 6 cc (150 mg), 60-micron particle size cartridge, Waters Division of Millipore Corporation.
- 3. Nylon Acrodisc<sup>®</sup>, 0.2 micron, Gelman Sciences.
- 4. Vac-Elut SPS 24, Varian Analytical.
- 5. N-EVAP, Meyers Organomation Associates Incorporated-Model 112.
- 6. Vibrating or vortex mixer.
- 7. Syringe and plunger for filtration, 10 mL.
- 8. Graduated test tube, 15 mL (calibrated at 0.5 mL with methanol).

#### Instruments:

### System A:

- 1. LCQ™LC/MS<sup>n</sup> System. ThermoQuest/Finnigan Corporation
- 2. ThermoQuest/ThermoSeparation Products HPLC system, consisting of the SPC 1000 membrane degasser solvent module, the P4000 quaternary pump module, and the AS3000 autosampler.

### System B:

- 1. LCQTMDECA LC/MSn System. ThermoQuest/Finnigan Corporation
- 2. Waters 2690 HPLC system with autosampler.

  System B is provided as a back up system in case of the unavailability of system A. This analytical method was validated using system A.

page 3 of 38

Determination of Atrazine, Bromacil, Cyanazine, Diuron, Hexazinone, Metribuzin, Norflurazon, Prometon, Prometryn, Simazine, Deethyl Atrazine (DEA), Deisopropyl Atrazine (ACET), and Diamino Chlorotriazine (DACT) in Well Water By Liquid Chromatography-Atmospheric Pressure Chemical Ionization Mass Spectrometry

### Analysis:

Sample Extraction:

- 1. Allow each sample to come to room temperature. Pour the sample from 1 L amber glass bottle into a 1000 mL beaker. Record the sample weight in grams (g) by weighing the bottle before and after transfer. Sample weight should be close to 500.0 g. Adjust pH to ~3 with 6N HCL. Add 0.1 μg propazine (100 μL of lng/μL spiking solution in methanol) as a surrogate to the sample. Note: The volume of methanol in spiking solution added to the sample should be 0.1% or less of the sample volume.
- 2. Two MCX cartridges are connected together in tandem and connected to the house vacuum using the manifold as shown in Diagram # 1.
- 3. Condition the cartridges at a flow rate of about 10 mL/minute with about 15 mL of methanol followed by about 15 mL of purified water by applying vacuum.

  \*Do not let the cartridges go to dryness.\* Turn off the vacuum when the purified water has

just passed through the cartridges. Detach the cartridges from the vacuum line and fill up the cartridges with purified water.

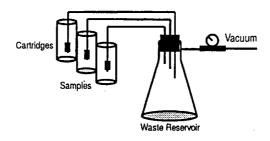

Diagram # 1

- 4. Reattach the conditioned cartridges to the vacuum line and transfer to the 1000 mL beaker containing the water sample. Allow the sample to pass through the conditioned cartridges by applying vacuum. Adjust the flow rate to about 10 mL/minute to 15 mL/minute.
- 5. After all of the water sample has passed through the cartridges, remove the cartridges and insert them into the inlets of the Vac-Elut SPS 24 at the "waste position". Turn the vacuum on (~5 psi) for 2 minutes to dry the cartridges. Turn the vacuum off and reverse the order of the cartridge positions. Add 5 mL of elution reagent to each cartridge. Switch the Vac-Elut SPS 24 to the "collect position" and turn the vacuum on. Elute all chemicals with ~5 mL of 5 % ammonium hydroxide in methanol at a flow rate of about 5 mL/minute. Collect the eluant into a 15 mL graduated test tube.
- 6. Filter the eluant through a 0.2 μm Acrodisc into a 15 mL graduated test tube which has been calibrated at 0.5 mL using methanol with a 500 μL syringe. Concentrate the eluant to ~0.2 mL in a 40 °C waterbath under a stream of nitrogen. Add 0.1 μg trietazine (100 μL of 1 ng/μL spiking solution) to the eluant as an internal standard. Bring to a final volume of 0.5 mL with reconstitution reagent (75/25 water / methanol). Vortex for 30 seconds. Transfer the eluant into three autosampler vials with inserts. Analyze by APCI/LC/MS/MS.

page 4 of 38

Determination of Atrazine, Bromacil, Cyanazine, Diuron, Hexazinone, Metribuzin, Norflurazon, Prometon, Prometryn, Simazine, Deethyl Atrazine (DEA), Deisopropyl Atrazine (ACET), and Diamino Chlorotriazine (DACT) in Well Water By Liquid Chromatography-Atmospheric Pressure Chemical Ionization Mass Spectrometry

### **Instrument Conditions:**

Tuning and Calibration of the LCQ/DECA Ion Trap LC/MS:

SOP # EM 501.4 describes the procedures to be followed for tuning and calibration of the LCQ Ion Trap LC/MS. After a retune or recalibration according to these procedures, the tune should be optimized for the triazine screen by tuning on the 253 (M+H)+ pseudomolecular ion of hexazinone. With the APCI source installed, a 10 ng/ $\mu$ L solution of hexazinone standard in methanol is infused at 5  $\mu$ L/minute into an HPLC column flow of 75:25 mobile Phase A: mobile Phase B. The manual tuning procedures outlined in SOP # EM 501.5 are used to optimize each of the source parameters by maximizing the signal at m/z 253. The optimized tune should be saved as a new tune file, with the starting tune file and the tune procedure recorded in the audit trail. All retuning and recalibration must be recorded in the LCQ instrument log book.

## Data File Handling:

All applicable procedures specified in SOP # EM 501.5 "LCQ Ion Trap LC/MS Data File Handling", must be followed. Data files will not be stored properly if there is insufficient disk space on the destination drive (C: or D:). Before beginning a data acquisition sequence, the free disk space on the destination drive must be checked. If less than 1.2 Gbytes is available, files should be moved to the alternate drive or CD Rom or ZIP media and deleted from the destination drive before proceeding. Data acquisition sequences must be recorded in the LCQ Injection Log notebook, noting the project, column, and approximate number of standard, blank and sample solutions injected.

Convectron and ion vacuum gauge readings taken after equilibration of the source at the method operating conditions should also be recorded in the back of the Injection Log notebook.

Following a successful data acquisition sequence, all files (tune, method, sample list, data, LCQuan and Excel) should be archived on CD Rom or ZIP media dedicated to the specific project. Each instrument operator should maintain a separate notebook documenting LCQ method development, and sample preparation and analysis.

### Instrument Settings and Parameters:

All specified instrument settings and parameters for both the LCQ and the liquid chromatograph are those used for method validation. It is the responsibility of the analyst to evaluate the method performance for a mixture of standards or other system suitability check solution. Over time, conditions may change due to a variety of effects including reagent batch, ambient temperature or system contamination. The analyst has the discretion to modify the tune or method files as required to fine tune the method performance. Note that a complete copy of the method as run, along with continuous status checks of all parameters and settings are stored with the data file, so that modifications are self-documenting. A summary of any modifications should also be recorded in the appropriate project notebook.

Determination of Atrazine, Bromacil, Cyanazine, Diuron, Hexazinone, Metribuzin, Norflurazon, Prometon, Prometryn, Simazine, Deethyl Atrazine (DEA), Deisopropyl Atrazine (ACET), and Diamino Chlorotriazine (DACT) in Well Water By Liquid Chromatography-Atmospheric Pressure Chemical Ionization Mass Spectrometry

# Instrument Conditions: (con't)

## APCI Source Settings:

Vaporizer Temp (°C):	450
Sheath Gas Flow Rate (arb):	90
Aux Gas Flow Rate (arb):	10
Discharge Current (μA):	5
Discharge Voltage (kV):	5
Capillary Temp (°C):	200
Capillary Voltage (V):	36
Tube Lens Off Set (V):	30
Total Microscans:	3

Note: The listed values are typical for the specified parameters. Values will vary somewhat (Discharge Voltage, Tube Lens Off Set) when the instrument is tuned. The values saved in the method tune file should not be changed unless the LCQ is retuned (see above for LCQ tuning and calibration).

# HPLC Settings for Waters SymmetryShield™C18:

Analytical column: Waters SymmetryShield™ 150 mm x 3.9 mm x 5 µm.

Guard column: RP-18, C18 7 µm x 15 mm x 3.2 mm.

Injection volume: 50 μL. Pump program steps:

Time (min.)		Flow rate (mL/min.)	<u>%</u> A	<u>%B</u>
0.00		0.75	15	85
4.00		0.75	15	85
15.00		0.75	100	00
20.00	•,	0.75	100	00
20.50		0.75	15	85
25.00		0.75	15	85

Mobil phase A: 95/5 (10 mM ammonium formate/methanol), 0.1% formic acid. Mobil phase B: 90/10 (methanol/0.1 M ammonium formate), 0.1% formic acid.

Note: Method performance for a given analyte can be affected by LC column aging, system contamination, and especially matrix interferences in a given sample. The analyst has the discretion to modify the data acquisition parameters to fine tune method performance based on the data observed.

LCQMS Detector Settings for Waters SymmetryShield™C18: These MS detector settings (alpha method) are for the analyses of Diamino Chlorotriazine (DACT), Deethyl Atrazine (DEA), Deisopropyl Atrazine (ACET), Propazine, Trietazine, Hexazinone, Cyanazine, Prometon, Atrazine, Diuron, and Prometryn.

MS run time (min.): 18.0

Divert valve (min.): 0.00 to waste.

#### Calculations:

The results are reported in  $\mu g/L$ :

 $\mu g/L = \mu g/mL$  (from standard curve) x final volume (mL) x 1000 g/L Sample weight (g)

#### Method Performance:

Quality Control:

- 1. Sample storage: All field samples shall be kept refrigerated at  $4 \, ^{\circ}\text{C} \pm 2$  until extracted.
- 2. Sample extraction: All extracts shall be kept refrigerated at 4 °C  $\pm$  2 until analyzed.
- 3. For each set of samples, at least one matrix blank and one matrix spike shall be included. Each set of samples shall not contain more than twelve samples.

#### Recovery data:

This analytical method was validated by preparing five sets of samples using the provided background well water. Each set contained four different levels of spike and a matrix blank. Each set was processed through the entire analytical method on a different day. Each sample was injected twice on each column. The results were averaged and are shown in Appendices I and II.

#### Method detection limit (MDL):

Method Detection Limit (MDL) refers to the lowest concentration of analytes that a method can detect reliably. To determine the MDL, 7 replicate background samples were spiked at 0.100 µg. The standard deviation from the spiked samples was used to calculate the MDL using the following equation:

Method detection limit (MDL): :(con't)

where:

t is the Student t value for the 99% confidence level with n-1 degrees of freedom and S denotes the standard deviation obtained from n replicate analyses. For the n=7 replicates used to determine the MDL, t=3.143. See Appendix IV for recovery data from the determination of the Method Detection Limits.

The Reporting Limit (RL) refers to the level at which quantitative results may be obtained. By convention, the RL is chosen in a range 1-5 times the MDL. The Reporting Limit for this method is  $0.05 \,\mu g/L$  for all analytes.

#### Discussion:

Propazine is used as a surrogate for the method analytes. 0.1 µg of propazine is added into each sample and processed through the entire analytical method. This allows the extraction steps to be monitored for acceptable recovery. A calculated recovery for propazine of 75 - 125% (acceptable range) of the amount spiked indicates that the recovery of the analytes in that sample is within acceptable range. If the recovery of the analyte is out of the acceptable range, the sample needs to be re-extracted. See Appendix III for recovery data.

Trietazine is used as an internal standard to monitor the injection volume supplied by the autosampler. The internal standard is added to each sample at the end of the evaporation of excess methanol from sample and matrix extracts. 0.1 µg of trietazine is added to the eluant when it is evaporated just below 0.2 mL. The volume of the extract is then adjusted to 0.5 mL with 75:25 water: methanol. See Appendix III for recovery data.

The segment durations in mass spectrometer settings determine the retention time windows for each analyte. As the HPLC column performance may change over time because of irreversible contamination, phase stripping, etc., it may be necessary to adjust these windows before beginning a sequence for the observed retention times of the analytes. Installation of a new guard column or analytical column may also necessitate adjustments of window times.

Two instrument methods have been developed on system B (LCQDECA) using Phenyl-hexyl and Waters SymmetryShield™ C18 columns. These methods were not used to validate the analytical method. They should be used only as back-up methods.

A standard curve consisting of five levels was used for every twelve injections. Each sample was injected twice back to back. The external standard technique with the average of all standard levels from the begining of a sequence to the end of a sequence was used to quantify samples. The response of a same level standard before and after samples should not differ by more than 25%. If the results are not in acceptable range, a root analysis should be done to indentify the causes. Diuron and Bromacil sometimes have shown very high recoveries on the phenyl-hexyl column for an unknown reason.

After each sequence is completed, the column should be rinsed with high organic mobile phase solution for few hours and stored in that condition. Before starting a sequence, test standards should be run first to ensure that the column is fully equilibrated. Test standards will not be used in quantitation.
